

**Further Notes on *Chrysomya Megacephala* (Fabr.)
(Diptera).**

BY J. F. ILLINGWORTH.

(Presented by E. H. Bryan, Jr., at the meeting of November 1, 1923.)

I wish to add the following notes on the distribution of this species. In Yokohama during July, 1923, I took four males in a fly-trap, in a sweet shop. Yet, during extensive collecting in this region, in June and July, I got no other specimens, even on exposed carrion; a fact which indicates that this species is rare in this latitude. Collecting in Hokkaido failed to reveal a single specimen, though Dr. Matsumura's extensive collection in the Imperial University at Sapporo contained numerous material, both males and female, from the Ladrone Islands, and a male taken at Baguio, Luzon, P. I., by Prof. C. F. Baker.

In Kyoto I took a single male of this species in a fish market, October 1, 1923. I also found this fly in a collection from India, determined by Brunetti, at the Shimazero Seisachio Specimen Department.

Thus these records extend the range recorded in my original notes on this species (Proc. Haw. Ent. Soc. V. pp. 266-7, 1923), and indicate that Yokohama is the northern limit of this semi-tropical fly.
